Linear Equations If we plot all the solutions to a linear equation on a graph, they form a line. That is why they are called linear equations. Linear equations can be written in slope-intercept form. There are two important things to know when writing the equation of a line in slope-intercept form; the slope and the y-intercept.

A system of linear equations, also called a linear system, consists of two or more linear equations that have the same variables. A solution of a system of linear equations with two variables is an ordered pair that satisfies all of the equations in the system. The values of the variables in the ordered pair make each equation in the system true.

A linear equation is an equation for a straight line. These are all linear equations: ... Let us look more closely at one example: Example: $y = 2x + 1$ is a linear equation: The graph of $y = 2x + 1$ is a straight line . When x increases, y increases twice as fast, so we need $2x$; When x is 0, y is already 1. So $+1$ is also needed; And so: $y = 2x + 1$;
