In power engineering, the power-flow study, or load-flow study, is a numerical analysis of the flow of electric power in an interconnected system. A power-flow study usually uses simplified notations such as a one-line diagram and per-unit system, and focuses on various aspects of AC power parameters, such as voltages, voltage angles, real power and reactive power.

An overhead power line is a structure used in electric power transmission and distribution to transmit electrical energy across large distances. It consists of one or more uninsulated electrical cables (commonly multiples of three for three-phase power) suspended by towers or poles. Since most of the insulation is provided by the surrounding air, overhead power lines are generally the least ...

To decompose a given time series on a scale-by-scale basis, the wavelet analysis is introduced. The early research on the application of wavelet method in economics and finance was carried out by Ramsey and Usikov [] and Ramsey and Zhang []. More recent contributions, among others, are Lee [21, 22], Lin and Stevenson [], Gencay and Selcuk [24–27], Hong and Kao [], and In and Kim [].

Therefore, Electric Power Load Forecasting (EPLF) is a vital process in the planning of electricity industry and the operation of electric power systems. Accurate forecasts lead to substantial savings in operating and maintenance costs, increased reliability of power supply and delivery system, and correct decisions for future development.
