Practical Graph Mining With R

Practical Graph Mining with R presents a "do-it-yourself" approach to extracting interesting patterns from graph data. It covers many basic and advanced techniques for the identification of anomalous or frequently recurring patterns in a graph, the discovery of groups or clusters of nodes that share common patterns of attributes and relationships, the extraction of patterns that distinguish one category of graphs from another, and the use of those patterns to predict the category of new graphs.

- A graph with higher connectedness is considered to be more resistant to link failures • Example: connectedness() -The R function connectedness takes one or more graphs and returns the Krackhardtconnectedness scores In our 10-node graph, nodes 1-9 are each connected to 8 other nodes, and node 10 is not connected to any.
